

CUSTOMER & MVP BLUEPRINT

SkillTwin AI

Customer research and MVP scoping, built from the existing Startup Validation Report (Day 22).

Extracted from uploaded Startup Validation Report:

Idea: AI-powered digital career twin — analyzes skills/GitHub/resume, identifies role-specific skill gaps, generates weekly action plans.

Problem: ~45% graduate employability, only ~10% of India's engineering grads placed (TeamLease, 2024).

Target: College students (18-25, India) + college placement cells (B2B2C).

Competitors: Internshala, Unstop, Naukri Campus, LinkedIn, Coursera, Scaler/Masai, Teal/Careerflow.

Validation status: **None yet** — idea-stage, Founder-Market Fit 6.5/10, prior recommendation: Conditional GO.

EXECUTIVE SUMMARY

Where This Stands

SkillTwin AI addresses a well-documented, large-scale problem — graduate employability in India — with a differentiated angle (continuous, role-specific readiness diagnosis vs. generic job/course listings). The prior Validation Report confirmed **no direct competitor combines this exact loop**, but also flagged **zero user validation** and an unstated technical execution path as the top risks. This Blueprint translates that validated problem into a concrete customer profile and a scoped, buildable MVP — deliberately narrow, so the riskiest assumptions get tested fastest.

IDEAL CUSTOMER PROFILE

Who This Is For

Primary ICP

- College students, 18-25, India
- Final/penultimate-year, engineering/CS-adjacent
- Actively preparing for internships or first jobs
- Some GitHub/project activity, unsure if "enough"
- High anxiety around competitive placement outcomes

Secondary ICP (B2B2C)

- College placement cells & training institutes
- KPI-driven: improving placement statistics
- Currently using fragmented spreadsheets/generic LMS
- Budget-conscious, outcome-focused buyers

BUYER PERSONA

"Rohan" — The Anxious Final-Year Student

Rohan, 20 — Third-Year CS Student, Tier-2 City

Aspiring SDE/Data role · 2-3 online courses done · a couple of GitHub projects

Has no clear signal on whether he's competitive. Follows conflicting LinkedIn advice. College placement cell offers limited 1:1 guidance.

"I don't even know what I don't know. I just keep adding courses hoping something sticks."

TOP 10 CUSTOMER PAIN POINTS

What's Actually Broken

These extend the 4 pain points confirmed in the Validation Report into a fuller list — items 5-10 are reasoned extrapolations from the same problem space, not yet independently confirmed. Treat as an interview hypothesis, not proven fact.

- No clear roadmap — learns randomly without role-mapping
- No readiness signal — unsure "how close am I" to a role
- Fragmented tools — resume, courses, job boards don't connect
- Generic advice overload — conflicting LinkedIn/YouTube tips
- Limited 1:1 guidance from college placement cells
- Unsure which projects actually matter to recruiters
- Anxiety from peer comparison (seeing others get offers)
- Time/money wasted on courses that don't map to real roles
- Skill gaps only become visible after a rejection — too late
- Hard to translate GitHub/project work into recruiter-relevant language

CUSTOMER JOURNEY

Awareness → Consideration → Purchase → Retention

KEY OBJECTIONS & BUYING TRIGGERS

What Blocks — and Prompts — a Decision

Buying Triggers	Key Objections
Internship season approaching	"Better than free YouTube/LinkedIn advice?"
Peer got an offer, they didn't	"Can I actually afford this as a student?"
Rejected, unsure why	"How accurate is the AI's gap analysis, really?"
College announces placement season	"Is my GitHub/resume data handled safely?"

MVP RECOMMENDATION

Build the Smallest Thing That Tests the Core Bet

Build First	A manual/semi-automated skill-gap diagnostic for ONE role family only (e.g., SDE/Data). Input: resume + GitHub. Output: structured gap report + weekly roadmap.
Do NOT Build	Multi-role support, native mobile app, gamification, automated job-matching, B2B placement-cell dashboard — all premature before the core diagnosis is validated.
Success Metrics	>60% of test users rate the diagnosis "specifically accurate" · visible Week-1→2 roadmap follow-through · >15-20% willingness-to-pay conversion in concierge test

MOSCOW PRIORITIZATION

Scoping the V1 Build

Must Have - Resume + GitHub input - Gap diagnostic vs. one target role - Weekly action plan output - Basic user accounts
Should Have - Progress tracking over time - Role-readiness score - Linked resource/course suggestions
Could Have - Anonymized peer benchmarking - Multi-role-family support - Placement-cell (B2B2C) dashboard
Won't Have (v1) - Native mobile app - Gamification/badges - Automated job applications

PRICING HYPOTHESIS

To Be Tested, Not Assumed

Freemium: free initial readiness score as a viral top-of-funnel hook → paid tier (est. ₹299-499/month or ₹1,999-2,999/semester) for ongoing roadmap + progress tracking. Secondary revenue: B2B2C institutional licensing to placement cells, post-validation. **This is a hypothesis to test in Week 3 of the plan below, not confirmed pricing.**

TOP 5 RISKS

Carried Forward from the Validation Report

Risk	Level
Zero validation to date	High
Technical/AI execution complexity	High
Student willingness-to-pay	Medium
Competitive response from funded incumbents	Medium
Institutional (B2B2C) sales cycle length	Medium

30-DAY MVP PLAN

From Interviews to a Build/Pivot Decision

Week 1	Interview 30-50 students (own college + 2-3 others) — validate the 10 pain points above; no pitching
Week 2	Build the manual diagnostic for ONE role family; deliver to 10-15 real students
Week 3	Offer it at a real price to 15-20 students; track actual conversion, not just interest
Week 4	Synthesize data → decide: build automated MVP, pivot, or pause

FOUNDER ACTION SHEET

Top 10 Next Actions

- 1 Draft a 10-15 question interview script for pain-point discovery
- 2 Recruit 30-50 interview candidates (own college + 2-3 others)
- 3 Conduct interviews; synthesize themes weekly
- 4 Pick ONE target role family for the MVP (e.g., SDE)
- 5 Build a manual gap-diagnostic template for that role
- 6 Deliver 10-15 manual diagnostic reports to real students
- 7 Set a real price; test conversion with 15-20 students
- 8 Track whether students actually follow the roadmap
- 9 Compile findings into an updated Go/No-Go memo
- 10 Decide: automate the MVP, pivot, or pause

SCORES

0-100

FINAL VERDICT

🌀 Promising but Unvalidated

Problem severity is high and well-evidenced; the ICP and MVP scope are now concrete and buildable. But Customer Clarity, PMF Potential, and MVP Readiness all remain low-to-moderate because **nothing here has been tested with real users yet**. This verdict should upgrade to 🟢 once the 30-Day Plan produces real interview and conversion data — or downgrade to 🟡 if interviews don't confirm the pain points as described.
