

PRODUCT DISCOVERY — INTERVIEW DECISIONS

Capstone: 10-Day Data Analytics / Business Intelligence Product

Status: Product discovery in progress — 14 questions completed

This document records the decisions made so far. It is **not** the final PRD, Implementation Blueprint, or Pitch Deck. Those will only be generated after the remaining discovery interview is complete and the finalized project is explicitly approved.

Current Product Direction

A personal finance analytics product for **young professionals** that automatically analyzes uploaded transaction data, helps users understand where their money is going, and forecasts **category-wise spending for the next month** with an expected range.

#	Question / Decision	Selected answer
1	Primary career/project direction	Data Analytics / Business Intelligence
2	Problem domain	Finance & Personal Spending
3	Target users	Young professionals
4	Core outcome	Understand where my money is going
5	Second outcome	Forecast future spending
6	Data source	Both demo dataset + user-uploaded data
7	Forecast target	Category-wise spending
8	Upload experience	Automatic analysis
9	Required transaction columns	Date, Amount, Category, Payment Method, Description
10	Forecast presentation	Forecast + expected range
11	Historical data preference	12 months
12	If less than 12 months	Forecast anyway with a warning
13	Data-quality handling	Detect problems and show them to the user
14	Dashboard priority	Spending Forecast

Important Product Rules Established

- The product is focused on young professionals rather than everyone.
- Users can explore a demo dataset or upload their own transaction file.
- Automatic analysis is the preferred upload experience.
- The minimum supported standard transaction fields are Date, Amount, Category, Payment Method and Description.
- Forecasting focuses on category-wise spending rather than total spending.
- Forecasts include an expected range to communicate uncertainty.
- Less than 12 months of history does not automatically block forecasting; the product will warn the user that reliability may be lower.
- Data-quality problems should be detected and shown to the user rather than silently modified.
- The project is being optimized for an impressive but fully completable 10-day capstone.

Next Discovery Stage

The interview is continuing. The next questions will define the remaining product experience, scope boundaries, success criteria, and final v1.0 behavior. After that, the complete project will be summarized in one paragraph for your approval before any final project documents are generated.
